

You have reached the final step of this assignment! Opening the database directly helps you understand that your code is just an interface for a standard, regular file on your disk.

Step-by-Step Instructions

1. **Open DB Browser for SQLite** on your computer.
 2. Click **Open Database** and select the `tasks.db` file located in your project folder.
 3. Navigate to the **Execute SQL** tab.
 4. Copy, paste, and run each query one by one to see how the database engine responds to your commands.
 5. While keeping your API server running, call `GET /tasks` from your terminal after running your updates. You will see that your code instantly responds with the changes you made by hand in the database UI.
-

Document Your Findings

Open your project's `README.md` file and append your exploration observations under a new heading. Here is an example of what you can add:

markdown

🔍 Stage 4: SQLite Exploration Reflections

I queried the database directly using DB Browser for SQLite:

- **Query Ran:** ``SELECT COUNT(*) FROM tasks;``
- **Result Returned:** It returned a single row and column showing the total number of tas

This step proved that both the application code and the DB Browser interface look at the e

Use code with caution.

Git Version Control Commit

Once your documentation update is saved, record your final stage progress to your git log tree using your terminal client:

```
bash
```

```
git add README.md  
git commit -m "Stage 4: explored SQLite"  
git push
```
